| \mathbf{Fib}_{ℓ} | onacci series and recursion |
| 3.1 | Recurrence relation |
| 3.2 | Inductive proofs and recursion |
| | 3.2.1 Base Case |
| 3.3 | Fibonacci Q-Matrix |

1.
$$|A \cup B| = |A| + |B| - |A \cap B|$$

2 Pigeonhole principle

If |A| > |B| (size of A > size of B), then every function from A to B maps at least 2 distinct elements of A to the same element of B. In other words:

For
$$f: A \to B \ \exists x_1, x_2 \in A, x_1 \neq x_2 \ \text{such that} \ f(x_1) = f(x_2)$$

Example 2.1.

$$A = \{x \mid x \in \mathbb{Z} \text{ and } |x| \le 5\}$$
$$B = \{x \mid x \in \mathbb{N} \text{ and } x \le 5\}$$

As you can see, |A| > |B|, so all valid functions between A and B must map at least one pair of x values to the same y value.

$$f: A \to B$$
$$f(x) = x^{2}$$
$$f(-5) = 25$$
$$f(5) = 25$$

Example 2.2. A human has a maximum of approx 200,000 hairs on his head. Prove that at least 2 people in London have exactly the same number of hairs on their head.

Let
$$A = \{x \mid x \in \mathbb{N} \text{ and } x \le 8.9 \times 10^6 \}$$

Let
$$B = \{x \mid x \in \mathbb{N} \text{ and } x \le 200,000\}$$

|A|>|B| therefore a function $f:A\to B$ must map at least 2 values in A to the same B value.

3 Fibonacci series and recursion

$$|A| = \text{cardinality of set } A = \#\{a | a \in A\}$$

3.1 Recurrence relation

$$f_n = f_{n-1} + f_{n-2}$$
$$\begin{pmatrix} f_n \\ f_{n-1} \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 1 & 0 \end{pmatrix} \begin{pmatrix} f_{n-1} \\ f_{n-2} \end{pmatrix}$$

3.2 Inductive proofs and recursion

 $\forall n: P(n)$

- 1. Base Case: First, prove P(1) is true
- 2. Induction Step

Assume P(0), P(1), ..., P(n) are all true (Induction hypothesis) Use the assumption above to prove P(n+1)

If P(n+1) = True, proven

Example 3.1. Prove that the sum of all natural numbers adds up to $\frac{n(n+1)}{2}$ using a proof by induction.

So we need to prove $0 + 1 + 2 + ... + n = \frac{n(n+1)}{2}$. Base case proof:

Let
$$n = 1 : 0 + 1 = \frac{1(2)}{2} = 1$$
: works for $n = 1$

Now, we assume n = k holds (Induction Hypothesis):

$$1 + 2 + \dots + k = \frac{k(k+1)}{2}$$

And we need to show n = k + 1 works:

$$1 + 2 + \dots + k + (k+1) = (1+2+\dots+k) + (k+1) = \frac{k(k+1)}{2} + (k+1)$$
$$= \frac{k(k+1) + 2(k+1)}{2} = \frac{k^2 + 3k + 1}{2} = \frac{(k+1)(k+2)}{2} \quad \Box$$

3.2.1 Base Case

This case proves that the property holds for the first item. It doesn't have to begin with n=0, it often starts with n=1 but it can start with any number within the given set.

3.3 Fibonacci Q-Matrix

The Q matrix is defined by:

$$Q = Q^1 = \begin{pmatrix} 1 & 1 \\ 1 & 0 \end{pmatrix}$$

The n^{th} value is given by:

$$Q^n = \begin{pmatrix} F_{n+1} & F_n \\ F_n & F_{n-1} \end{pmatrix}$$
